

Annual Self-Review — Aman Kumar

QA Engineer · CMS / Wilyer Signage · Review period: 7 Aug 2025 – 23 Jul 2026 · Submitted 23 Jul 2026

HEADLINE IMPACT

I reported **948 issues — 55% of everything the entire team logged** (1,724 workspace tasks), nearly double the next contributor. **608 of my reports (64%) have already shipped as fixes**, directly improving product quality across six platforms. Every figure below is verifiable in ClickUp.

948 ISSUES REPORTED	55% OF ALL TEAM TASKS	608 SHIPPED AS FIXES (64%)	6 PLATFORMS COVERED	37 CLICKUP LISTS
---	---	--	---	--

SCOPE OF OWNERSHIP

- **Platforms:** CMS POC Sample (cms.pocsample.in), CMS Live (Wilyer Signage), Android Player, LG webOS, Samsung Tizen, BrightSign / Raspberry Pi, Windows, On-Premise
- **Modules:** RBAC / Group-in-Group, folder system, playlists, screens, widgets, Media Sets, Prayer Schedule, rollout, reports, direct file publish
- **Beyond manual QA:** built and maintain Playwright E2E automation (cms-e2e suite, RBAC role-permission specs, Media Sets, Prayer Schedule), page-object architecture, CI workflow, and ClickUp reporting tooling

KEY WINS

WIN	EVIDENCE
Drove POC Sample to near-zero defect backlog	171 of 174 issues resolved (98%)
Owned QA for the year's biggest initiative — RBAC / Group-in-Group	210 issues found (incl. 54 merge bugs), 93% fixed before release
Sustained release-crunch regression sweeps	179 issues in Jul 2026 alone (RBAC merge + POC regression); 154 in Apr 2026
High-signal reporting	64% of all my reports converted into shipped fixes
Test automation as an engineering contribution	Playwright E2E suites with fixtures, page objects and CI; structured test reports (auto-login widgets, media sets, prayer-schedule CRUD 16/16 green)

RISKS I SURFACED

- **LG / Samsung:** 25 of 26 reported issues remain in backlog — release risk for TV deployments.
- **On-Premise:** 9 of 10 reports unresolved, incl. licensing and 2FA gaps filed Jul 2026.
- Escalated both for platform-team capacity; tracking to closure next quarter.

GROWTH THIS PERIOD

- Moved from purely manual verification to **automation-first QA**: Playwright + TypeScript, MCP-driven test generation, API-level checks.
- Built repeatable reporting: live ClickUp API pulls → work reports and dashboards, replacing manual status collation.

GOALS — NEXT PERIOD

1. Reduce LG/Samsung + On-Premise open backlog from 34 to **under 10**.

2. Expand automated E2E coverage to all critical CMS flows — screens, library, playlists, RBAC smoke on every deploy.
3. Cut manual regression time by **30%** via suite parallelisation and CI gating.
4. Establish defect-escape tracking (production vs pre-release bugs) as a standing quality metric.

Supporting evidence: full task-by-task report (clickup-work-report-aman-kumar-2025-08-07_2026-07-23.pdf) · interactive dashboard (Claude artifact) · ClickUp CMS space (ID 90162815762), team 9016764704. Counts: tasks created by ClickUp user 224612443, 7 Aug 2025 – 23 Jul 2026; workspace total includes all creators and subtasks. Generated from the live ClickUp API on 23 Jul 2026.
