

CMS E2E — Test Execution Report

Suite	cms-e2e (TypeScript Playwright)
Target	https://cms.pocsample.in
Project	chromium (Desktop Chrome, 1440×900)
Mode	Headless · 4 workers · non-destructive (CMSALLOWDESTRUCTIVE=false)
Date	2026-06-23
Duration	11.2 min
Branch	fix/cms-e2e-library-tabs-and-playlist-404-guard

1. Summary

Outcome	Count
✔ Passed	64
✖ Failed	8
⚠ Flaky (passed on retry)	1
⏸ Skipped (destructive gated)	4
⏹ Did not run	6
Total	83

Every CMS module loaded and passed its core checks. Of the 8 failures, **1 is a confirmed product bug, 4 point to a client-side authorization/UX gap that needs product triage, **and** 3 are test-side issues** (selector / data drift / infra flake) — not application defects.

2. Defects (real product issues)

BUG-1 — Deleted playlist throws an uncaught exception · Severity: High

- **Test:** tests/playlists/playlist-not-found.spec.ts:27
- **Steps:** Navigate directly to a deleted/non-existent playlist URL.
- **Expected:** "Playlist not found" message, no uncaught exceptions.
- **Actual:** The "Playlist not found" alert renders **and** the page throws:

...

[pageerror] TypeError: Cannot read properties of undefined (reading 'forEach')

...

- **Assessment:** Graceful on the surface, but a component still iterates `undefined`. The 404-guard test correctly caught a live crash. Reproducible.
- **Action:** File a ticket; attach console trace + test-results/.../trace.zip.

3. Needs product triage (authorization / UX)

TRIAGE-1 — Direct-URL access to restricted routes is not redirected/denied

- **Tests:** tests/permissions/permissions.spec.ts:104 for /team, /billing, /admin, /management (4 failures).
- **Observed:** Restricted role user (amankumarbsrbsn@gmail.com) authenticates; sidebar is correctly trimmed (no Team / Billing / Reports links — UI fencing works). The API-403 graceful-handling test **passed**, so data appears

protected server-side. However, typing a restricted URL keeps the user on the route with **no redirect and no "Access Denied"** surface.

- **Assessment:** Likely a **client-side routing gap**, not a confirmed data leak. Caveat: `/admin` and `/management` are *guessed* routes that may not exist — that portion is a test-design weakness. `/team` and `/billing` are real routes and warrant a product look.
- **Action:** Verify `/team` & `/billing` direct-URL behaviour live before escalating; tighten the test to drop guessed routes.

4. Test-side issues (not application bugs)

ID	Test	Root cause	Fix		
TEST-1	<code>tests/billing/billing.spec.ts:12 & :31 (expectPlansLoaded)</code>	Page + all tabs load fine; admin account has no active licenses and the empty-state regex <code>/no (plan\</code>	<code>purchase\</code>	<code>data)/^</code> does not match the live copy → false failure.	Update empty-state matcher to the actual billing copy.
TEST-2	<code>tests/permissions/rbac-data-driven.spec.ts:256 (REVOKED → /reports)</code>	Expects a role card literally named "un" to pre-exist in Team → Roles; it no longer exists (data drift). Likely cascaded the 6 "did not run" in the serial block.	Seed/repair the role fixture.		
FLAKY-1	<code>tests/library/library.spec.ts:93 (clean console/API)</code>	<code>page.goto /library</code> hit the 30s nav timeout once, passed on retry . Known slow-app flakiness.	None — monitor; retries absorb it.		

5. Coverage notes

- **Not exercised this run (gated):** create / upload / delete paths — 4 destructive tests skipped by design. Re-run with `CMSALLOWDESTRUCTIVE=true` to cover them.
- **Fixed earlier this session:** Library upload trigger selector (`Upload Files` → `Upload Media`) and the upload wait (fixed sleep → upload response listener). Validated headed: 2 passed.

6. Modules verified (passing)

Auth · Dashboard · Library (load/search/filter/pagination/detail/perf) · Groups · Screens · Playlists (happy path) · Team · Reports · Billing (nav + tabs) · Permissions (positive entitlement, hidden-control, API-403 handling) · Accessibility (a11y) smoke.

7. Recommended next steps

1. File **BUG-1** (playlist `forEach` crash).
2. Triage **TRIAGE-1** (`/team`, `/billing` direct-URL guard) with the product team.
3. Fix **TEST-1** and **TEST-2** so the suite reflects true status.
4. Re-run with destructive enabled for full CRUD coverage.
